Software Development Skills

Mikael Norppa, 001867462

14.7.2026

Started the course by checking out the General Course Information page to get a hold of how the course will work.

Straight into the NodeJS module from the module task list. Watched the video along and did some of the coding tasks in the video to get a refresher. I have earlier experience with NodeJS but had forgotten about for example about crypto. The tutorial was very easy to follow along and brad from taversy was a very great teacher in the videos.

2nd module was about MongoDB and I've used mongo before. But I haven't dabbled into the cluster from the website itself, so that was a new thing I learned about it.

After MongoDB it was time for the ExpressJS module. Once again, have used ExpressJS before, but I wouldn't say I'm great at it. Followed the along the tutorial and tried to get a grasp on the topic to better understand how ExpressJS works. After finishing the video, can say that my knowledge on the topic was improved.

Final module was the React module. Again, have worked with this framework before, but once again, wouldn't say that I'm great at it. It's also been a while since I've worked with these frameworks, so these tutorials are truly a great refresher and I was unsure about routing before, but after the explanation and tutorial it was very clear!

After the modules were finished, I tackled on the project with the help of the tutorial. I extended the original project by adding a category field to each goal. Users can choose if the goal belongs to Personal, School, Work or Other category.

15.7

Made first commit of the project but ran into problems with .env file. Eventually got it fixed after multiple removals of repositories and did the commit of the project. Added readme and demo video link. Finally added the learning diary aswell.
